General Safety Considerations

Throughout the manual, important safety considerations are highlighted as follows:

**WARNING**  Warning alerts you to a serious hazard. If you do not read and follow instructions very carefully at this point, there is a risk of injury or even death.

**CAUTION**  Caution warns you of a potential hazard. If you do not read and follow instructions carefully at this point, the product could be damaged or important data could be lost.

**NOTE**  Note highlights important information on using the product.

Feedback

Vaisala Customer Documentation Team welcomes your comments and suggestions on the quality and usefulness of this publication. If you find errors or have other suggestions for improvement, please indicate the chapter, section, and page number. You can send comments to us by e-mail: manuals@vaisala.com.

ESD Protection

Electrostatic Discharge (ESD) can cause immediate or latent damage to electronic circuits. Vaisala products are adequately protected against ESD for their intended use. However, it is possible to damage the product by delivering electrostatic discharges when touching, removing, or inserting any objects inside the equipment housing. To make sure you are not delivering high static voltages yourself handle ESD sensitive components on a properly grounded and protected ESD workbench. When this is not possible, ground yourself to the equipment chassis before touching the connections. Ground yourself with a wrist strap and a resistive connection cord. When neither of the above is possible, touch a conductive part of the equipment chassis with your other hand before touching the boards.
Chapter 1 ________________________________________________________  General Information

Warranty

Vaisala hereby represents and warrants all Products manufactured by Vaisala and sold hereunder to be free from defects in workmanship or material during a period of twelve (12) months from the date of delivery save for products for which a special warranty is given. If any Product proves however to be defective in workmanship or material within the period herein provided Vaisala undertakes to the exclusion of any other remedy to repair or at its own option replace the defective Product or part thereof free of charge and otherwise on the same conditions as for the original Product or part without extension to original warranty time. Defective parts replaced in accordance with this clause shall be placed at the disposal of Vaisala.

Vaisala also warrants the quality of all repair and service works performed by its employees to products sold by it. In case the repair or service works should appear inadequate or faulty and should this cause malfunction or nonfunction of the product to which the service was performed Vaisala shall at its free option either repair or have repaired or replace the product in question. The working hours used by employees of Vaisala for such repair or replacement shall be free of charge to the client. This service warranty shall be valid for a period of six (6) months from the date the service measures were completed.

This warranty is however subject to following conditions:

a) A substantiated written claim as to any alleged defects shall have been received by Vaisala within thirty (30) days after the defect or fault became known or occurred, and

b) The allegedly defective Product or part shall, should Vaisala so require, be sent to the works of Vaisala or to such other place as Vaisala may indicate in writing, freight and insurance prepaid and properly packed and labelled, unless Vaisala agrees to inspect and repair the Product or replace it on site.

This warranty does not however apply when the defect has been caused through

a) normal wear and tear or accident;

b) misuse or other unsuitable or unauthorized use of the Product or negligence or error in storing, maintaining or in handling the Product or any equipment thereof;

c) wrong installation or assembly or failure to service the Product or otherwise follow Vaisala's service instructions including any repairs or installation or assembly or service made by unauthorized persons not approved by Vaisala or replacements with parts not manufactured or supplied by Vaisala;

d) modifications or changes of the Product as well as any adding to it without Vaisala's prior authorization;

e) other factors depending on the Customer or a third party.

Notwithstanding the aforesaid Vaisala's liability under this clause shall not apply to any defects arising out of materials, designs or instructions provided by the Customer.

This warranty is expressly in lieu of and excludes all other conditions, warranties and liabilities, express or implied, whether under law, statute or otherwise, including without limitation any implied warranties of merchantability or fitness for a particular purpose and all other obligations and liabilities of Vaisala or its representatives with respect to any defect or deficiency applicable to or resulting directly or indirectly from the Products supplied hereunder, which obligations and liabilities are hereby expressly cancelled and waived. Vaisala's liability shall under no circumstances exceed the invoice price of any Product for which a warranty claim is made, nor shall Vaisala in any circumstances be liable for lost profits or other consequential loss whether direct or indirect or for special damages.
CHAPTER 2

PRODUCT OVERVIEW

This chapter introduces the features of the GMP343.

Introduction to GMP343

Vaisala CARBOCAP® Carbon Dioxide Probe GMP343 is designed for high accuracy CO₂ measurements. The measurement is based on the advanced CARBOCAP® Single-Beam Dual-Wavelength NDIR technology. GMP343 consists of a CO₂ sensor, electronics, and a housing suitable for long-term outdoor use. There are two GMP343 models available: a flow-through model and a diffusion model. One adjustable analog output can be configured to output voltage or current signal (0 ... 2.5 V, 0 ... 5 V, 4 ... 20 mA). A digital output for RS232/RS485 communication is available. The measuring range options vary from 0 ... 1000 ppm to 0 ... 2 %CO₂.

The GMP343 can be ordered with various adapter, filter, and connection cable options. For a list of spare parts and accessories, see section Spare Parts and Accessories on page 82.
GMP343 Transmitter Components

Figure 1    Two Models of GMP343

The following numbers refer to Figure 1 above.
1 = Filter
2 = Wiring connector
3 = Gas in
4 = Gas out
5 = Back flange (do not open)

NOTE
Warranty is void if the back flange of the GMP343 has been opened by the user.
User Configurable CO₂ Measurement

The measurement output of the GMP343 is user configurable. You may have the raw data without filtering or compensation, or you may set the filtering levels, enable compensation (pressure, temperature, relative humidity, and oxygen) and linearization.

You can also select the measurement range to optimize the performance of the GMP343 for a certain concentration level. Selecting an appropriate measurement range increases accuracy, since it enables the range-specific compensation and linearization settings. For more information, see sections Setting the Measurement Range on page 41 and Temperature, Pressure, Relative Humidity, and Oxygen Compensations on page 47.

Principle of Operation

The infra-red sensor of GMP343 is based on the proprietary Vaisala CARBOCAP® sensing technology. Here the pulsed light from a miniature filament lamp is reflected and re-focused back to an IR detector which is behind a silicon-based Fabry-Perot Interferometer (FPI). This tiny FPI is tuned electrically so that its measurement wavelength is changed between the absorption band of the CO₂ gas and a reference band.

Figure 2  Principle of Operation
When the passband of the FPI coincides with the absorption wavelength of the CO₂ gas, the IR detector sees a decrease in the light transmission. The measurement wavelength of the FPI is then changed to the reference band (that has no absorption lines) and the IR detector sees a full light transmission. The ratio of these two signals indicates the degree of light absorption in the gas and is proportional to the gas concentration. It takes 2 seconds to measure this sequence and to calculate one reading.

Use of numerical filtering reduces the noise of the raw data. On the other hand, the filtering increases the response time of the device (see Figure 9 on page 44).

**Optics Heating**

Two heating elements are placed in the optics; one behind the mirror and one behind the window of the sensor. Heating should always be turned on when there is a risk of dew formation on the optics surface. The heating maintains the surface temperature of the optics a few degrees above the ambient temperature.

The heating is disabled by default. For instructions on how to control the optics heating, refer to section Setting the Optics Heating ON/OFF on page 61.

<table>
<thead>
<tr>
<th>NOTE</th>
</tr>
</thead>
<tbody>
<tr>
<td>The optics heating is automatically disabled when you connect the GMP343 to a MI70 indicator.</td>
</tr>
</tbody>
</table>

**Gas Sampling**

There are two GMP343 models available: a flow-through model and a diffusion model.

**Diffusion Sampling**

No sampling system is needed with the GMP343 diffusion model. The diffusion filter and the plastic filter cover protect the measuring chamber from dirt, water, and contaminants.
In order to have a quick measurement with very short response time the filter can be removed; see section **Response time (90 %)** on page 80. In this case the optics are openly exposed to contamination and cleaning of optics may be necessary more often. For instructions on cleaning the optics, refer to section **Cleaning the Optics (Diffusion Model Only)** on page 71. Removal of the filter is not recommended if there is a risk of getting water or dirt particles on the optics.

**Flow-Through Sampling**

The maximum gas flow rate is 10 liters/min. When using high flow rates, please note how the flow rate affects the accuracy, see Specifications, **Oxygen**, on page 79 (flow dependence). The volume of the internal measurement chamber is 59 ml ± 1 ml.

The gas sample must not include acidic gases.

| CAUTION | Liquids or acidic vapors may seriously damage the sensor. |

**Sampling System**

The GMP343 flow-through model has no diffusion filter inside the measuring chamber and the optics of the flow-through model cannot be cleaned by the user. Therefore the sample gas must always be filtered and dried before it is pumped to the measuring chamber. A hydrophobic diffusion filter before the inlet of the measuring chamber is needed in order to prevent particles and water from the surroundings from getting into the sensor. The diffusion filter needs to be exchanged often enough to provide a sufficient flow.

In humid environments it is important to avoid water condensation inside the measuring chamber. This can be avoided by drying the sample air. The most common method of drying the sample air is cooling and re-heating the air. A simple system may consist for example of a cooling coil and a water trap which are either cooled or located in a cool environment, followed by a re-heating system. The idea is to get the moisture in the sample to condensate on the walls of the copper tube, trap this water and then lower the relative humidity by heating the sample. If the temperature inside the measurement chamber is essentially higher than the surroundings the cooling coil and the water trap can be simply located outside the chamber. For re-heating, the heat
generated by a pumping system may sometimes be adequate, meaning that no additional heater is needed. A simplified schema of a sample system removing particles and moisture is illustrated below.

All sampling system components are commercially available.

![Diagram of the Sampling System](image)

**Figure 3** Components of the Sampling System

## Optional Accessories

Various adapter and filter options are available for the GMP343. For a complete list, see section **Spare Parts and Accessories on page 82**.

![Examples of Optional Accessories](image)

**Figure 4** Examples of Optional Accessories
Soil Adapter Kits for In-Soil Applications

The vertical/horizontal soil adapter kit consists of a soil adapter and a hydrophobic sintered PTFE filter. The kits are designed for in-soil CO₂ measurements to be used with the diffusion model of GMP343.

MI70 Indicator Connection

Vaisala MI70 indicator is an optional accessory to be used as a display, communication, and data-logging device for GMP343. When taking measurements GMP343 is powered via MI70.

Recharging the Battery Pack

MI70 indicator is equipped with a rechargable battery pack when shipped from factory. The battery pack is located behind the back plate of the indicator. The recharger is provided with one of the following AC-adapters: Euro, UK, US or AUS.

1. Recharge the battery pack as follows: Plug in the recharger connector into the connector on top of the indicator and connect the recharger to a wall socket. A battery symbol in the corner of the display starts to roll.
   - It is not recommended to use MI70 during the first recharging. Later on MI70 can be used while recharging.
   - Duration of recharging depends on the charge level of the battery pack being 4 hours typical. The recommended first recharging time is 6 hours.

2. The battery pack is full when the battery symbol in the display stops rolling.

3. Disconnect the recharger.
Structure of the MI70 Indicator

Figure 5 Structure of the MI70 Indicator

The following numbers refer to Figure 4 above:

1 = Recharging connector
2 = Power On/Off key
3 = Connection cable (DRW216050SP) for GMP343 connection
Using MI70 as a Display

Introduction of Function Keys and Menu Structure

Figure 6  Keyboard of MI70

The following numbers refer to Keyboard of MI70 on page 21:
1 = Function keys left/middle/right (can be assigned to shortcuts)
2 = Arrow keys up/down/left/right
3 = Power on/off key

Initialization of MI70

NOTE The optics heating is automatically disabled when you connect the GMP343 to the MI70 indicator.

1. Install the connection cable between MI70 and GMP343 (GMP343 is powered from MI70).
2. Turn on MI70 by pressing the Power On/Off key.
3. Select the language by using the up/down arrow keys. Confirm by pressing the SELECT key.
4. To change the date, select Date and press the SET key. Set the date by using the up/down/left/right arrow keys. To confirm the date, press the OK key.
5. To change the time, select **Time** and press the **SET** key. Set the time by using the up/down/left/right arrow keys. To confirm the time, press the **OK** key.

6. To check and change the environment settings, select **YES**. Enter ambient pressure, humidity, and oxygen values. Press the **EXIT** key.

**Navigation in Menu**

- To turn the indicator on or off, press the **Power On/Off** key.
- To open the main menu, press any of the arrow keys and then the middlemost function key in sequence.
- To move in a menu and select an option, press the up/down arrow keys. To enter sub-menu of selected option, press the right arrow key. To return to the previous menu level, press the left arrow key.
- To activate a function: press a function key according to the guiding text below the key.
- To return to the basic display directly from any menu levels, press the function key **EXIT**.

The main settings are found in the following menu locations:

- To change language, enter: **Settings - User interface - Language**.
- To select display quantities (carbon dioxide and temperature), enter: **Display - Quantities and units**. The carbon dioxide concentration is shown in **ppm** or in %-units and temperature in °C or °F.
- To set the ambient conditions enter **Environment** menu. Options to choose from: 1013 hPa, 50 % RH, and 20.9 % O₂.
Using MI70 in Recording

Record continuous measurement data and view the recorded data by using the MI70. This function is found from the menu RECORDING/VIEWING.

You can switch MI70 off during recording to save battery power. Display message tells you that recording continues undisturbed even when the power is off. If the indicator is switched off during recording, the progress bar is shown on the display every 10 seconds (all the time, if the charger is connected). This bar shows the amount of recorded data.

Save individual measurement data points with Hold/Save function (DISPLAY-HOLD/SAVE DISPLAY) and view the saved data from the RECORDING/VIEWING menu.

| CAUTION | Do not disconnect the probe when the data recording is on, even if the indicator is off. This may cause loss of recorded data. |

Transferring Recorded Data to PC

The recorded data can be transferred to a PC by using MI70 Link program. MI70 Link program can be ordered from Vaisala, see Table 12, List of Spare Parts and Accessories, on page 82. You can examine the recorded data easily in Windows and transfer it further to a spreadsheet program (such as Microsoft Excel) for modification.

More information on the data transfer and software features is found in the HELP-file of MI70 Link program.
CHAPTER 3
INSTALLATION

This chapter provides you with information that is intended to help you install this product.

Mounting

A horizontal mounting position is recommended in order to minimize the problems caused by possible condensation.

Figure 7  Mounting GMP343
1. Fasten the GMP343 to the mounting bracket by using the screw provided.
2. Mount the mounting bracket with 4 screws (on corners of the plate).
Wiring

As it is shipped from the factory, the measurement range and output of the GMP343 are scaled according to the order form completed by the customer. The unit is calibrated at the factory. The device is ready for use when the wiring is done and power is switched on.

GMP343 can be connected to a PC using an optional PC connection cable, see Table 12, List of Spare Parts and Accessories, on page 82.

For more information on serial commands, see Chapter 4, Operation, on page 29.

WARNING Make sure that the main power is switched off before making any electrical connections.

</tbody>
</table>
There are two pins per signal internally hardwired in parallel (pins 1 and 2, pins 3 and 7). You should connect the RS232C signal 'TX' (or 2-Wire RS485 signal 'A') either to the pin 1 or 2 and the RS232C signal 'RX' (or 2-Wire RS485 signal 'B') either to the pin 3 or 7.

Note that there is either an RS232 or a 2-wire RS485 communication interface available according to initial configuration. However, if the device is configured in RS485 output mode, the device can still be switched into RS232 mode by re-configuration via PC. For more information on serial commands and RS232/485 modes, see Chapter 4, Operation, on page 29.

**Wiring of the Junction Box**

The optional 8-pole junction box enables practical in-line connection. The box is provided with 8 numbered terminals.
This chapter contains information that is needed to operate the GMP343.

Connecting GMP343 to PC

Connection Cables

To connect the GMP343 to a PC, you need the PC Connection Cable (optional accessory 213379). If your PC does not have a serial port, you also need the USB-D9 Serial Connection Cable (optional accessory 219686). By connecting the two cables, you can use a standard type A USB port to connect the GMP343 to a PC.

Both cables are included in the PC Connection Kit that can be ordered with the GMP343.

Installing the Driver for the USB Cable

Before taking the USB cable into use, you must install the provided USB driver on your PC. When installing the driver, you must acknowledge any security prompts that may appear. The driver is compatible with Windows 2000, Windows XP, Windows Server 2003, and Windows Vista.
1. Check that the USB cable is not connected. Disconnect the cable if you have already connected it.

2. Insert the media that came with the cable, or download the driver from www.vaisala.com.

3. Execute the USB driver installation program (setup.exe), and accept the installation defaults. The installation of the driver may take several minutes.

4. After the driver has been installed, connect the USB cable to a USB port on your PC. Windows will detect the new device, and use the driver automatically.

5. The installation has reserved a COM port for the cable. Verify the port number, and the status of the cable, using the Vaisala USB Instrument Finder program that has been installed in the Windows Start menu. The reserved ports are also visible in the Ports section of the Windows Device Manager.

Remember to use the correct port in the settings of your terminal program. Windows will recognize each individual cable as a different device, and reserve a new COM port.

There is no reason to uninstall the driver for normal use. However, if you wish to remove the driver files and all Vaisala USB cable devices, you can do so by uninstalling the entry for Vaisala USB Instrument Driver from the Add or Remove Programs (Programs and Features in Windows Vista) in the Windows Control Panel.

Opening a Terminal Connection

The communication interface of GMP343 is RS-232 or RS-485. In case your device is configured to RS-485 communication mode you can still start communication in RS-232 mode (for example when changing the probe setting). See step number 4 in the following instructions.

1. Connect the GMP343 to the PC using the connection cable(s). Refer to section Connection Cables on page 29.

2. Connect the power cables to a 11 ... 36 V power supply.
3. Open a terminal program and set the communication parameters. When using the terminal session for the first time, save the settings for future use.

4. Power-up the GMP343. The device should prompt as follows:

GMP343 - Version STD 2.0
Copyright: Vaisala Oyj 2003 - 2006

5. If your device is configured to RS-485 communication mode, switch the device into the service mode by sending a string containing at least 6 capital 'Z' while powering up. The most convenient way using PC is:

Press and keep pressing \texttt{SHIFT} + 'z' while powering up GMP343. Keep pressing \texttt{SHIFT} + 'z' until GMP343 starts up in the service mode. The device should prompt as follows:

COMM PARAMETERS IN EEPROM:
SMODE : STOP
BAUD RATE: 19200
DATA BITS: 8
PARITY: NONE
STOP BITS: 1
ADDR: 0

HARDWARE CONFIGURATION:
COMM CHANNEL: RS485
ANALOG OUTPUT: VOLTAGE

GMP343 - VERSION STD 2.0
COPYRIGHT: VAISALA OYJ 2003 -2006
>ZZZZZZZZZZZ

6. Key in the commands with the keyboard of your computer and press enter. In this guide \texttt{<cr>} stands for pressing \texttt{ENTER}.
Operation modes of the GMP343

The GMP343 can operate in three different modes:

- **RUN mode**
- **STOP mode**
- **POLL mode**

In the **RUN** mode, the GMP343 sends measurement results at regular intervals. The included parameters and the interval can be set by the user. While in the RUN mode, the device will not answer any other command except the **S** command, which stops the RUN mode and switches the device to STOP mode.

The **STOP** mode is the default mode of operation for the GMP343, where most of the commands listed in this document are available. You can enter the STOP mode from the RUN mode with the S command, or from the POLL mode with the **OPEN <addr>** command, where <addr> is the unique address of the GMP343. While in the STOP mode, the GMP343 will respond to all unknown commands with the following string:

```
Unknown command.[cr][lf]>
```

The **POLL** mode is dedicated for bus interfacing. To work in the poll mode, each device must have its own unique address. You can enter the POLL mode by giving the CLOSE command in the STOP mode.

Only a single device can be accessed at a time in the POLL mode. In the POLL mode, you can request a single measurement message from the GMP343 using the **SEND <addr>** command. While in the POLL mode, the GMP343 will ignore all unknown commands.
Getting the Measurement Message

Measurement Units

GMP343 outputs the following units:

- Carbon dioxide (ppm)
- Temperature (°C)

For other measurement units (%, non-metric units), use the Vaisala MI70 indicator.

| NOTE | Measurement units (ppm and %) express the CO₂ concentration by gas volume. 1 % CO₂ = 10 000 ppm CO₂ |

Starting the Continuous Outputting

R <cr>

This command starts the continuous outputting of results (output form defined with the command FORM). Data is printed with the interval defined with the command INTV. Printing can be stopped with the command S.

> r  345.0 ppm
    344.1 ppm
    343.6 ppm
    345.6 ppm
    346.1 ppm
    344.1 ppm
    343.5 ppm
    345.5 ppm
>

Stopping the Continuous Outputting

S <cr>

Ends the RUN mode; after this command all other commands can be used.
Setting the Continuous Outputting Interval

INTV xxxx yyy <cr>

SAVE <cr>

xxxx=output interval (1...1000) default=1 s

yyy=unit (s, min or h)

Example: Output interval is changed to 5 seconds

> intv 5 s
INTERVAL : 5
UNIT      : S
>

Outputting the Reading Once

In STOP mode:

SEND <cr>

In POLL mode:

SEND aa <cr>

aa=address of the transmitter when more than one transmitter is connected to a serial bus (0...99).

The output mode can be changed with the command FORM.

> send
348.7 ppm
>
Setting the Serial Interface Measurement Mode

SMODE xxxx <cr>

SAVE <cr>

xxxx= STOP/RUN/POLL

In STOP mode: Measurements output only by command, all commands can be used (default mode).

In RUN mode: Outputting automatically, only command S can be used.

In POLL mode: Measurements output only with command SEND. For more details on POLL mode, see section, Networking Operation, on page 39.

The settings are not valid until the device is reset.

Setting Communication Hardware

Communication hardware can be chosen between RS-232 or RS-485. Command parameters are correspondingly 232 and 485.

RSMODE <cr>

SAVE <cr>

The setting is not valid until the device is reset.

>rs mode
RSMODE : 232? 485

>save
EEPROM saved successfully.
>
Serial Communication Settings

Save the changed settings by entering the SAVE command. The settings are not valid until the device is reset.

SERI <cr>

SAVE <cr>

Baud rate: (300, 600, 1200, 2400, 4800, 9600, 19200, 38400, 57600, 115200)

Note: When baud rate is > 19200 the character spacing must be > 1 ms. If the character spacing is not in use the device may lose some characters.

Data bits: (7/8)

Parity: (none, even, odd)

Stop bits: (1/2)

Key in the settings after the question mark and press ENTER.

>seri
BAUD RATE : 19200 ? 19200
DATA BITS : 8 ? 8
PARITY : NONE ? none
STOP BITS : 1 ? 1

Example 1:

> form CO2 " " "ppm" #r#n

> save
EEPROM saved successfully.
> send
336.3 ppm

Example 2:

> form "Filtered data" CO2 "ppm" #r#n
> save
EEPROM saved successfully
>
Example 3 (both filtered and raw data chosen):

```plaintext
>form CO2 "ppm" " CO2RAWUC "ppm" #r#n
>send
 296.5ppm  270.1ppm
```

### Setting Time

**TIME x <cr>**

**SAVE <cr>**

x=hh:mm:ss

Time passed since the last power on was displayed. Time always resets to 00:00:00 when power is switched off. However, the user can set the time.

**Example (time inquiry):**

```plaintext
>time
 04:00:52
>
```

**Example (time setting):**

```plaintext
>time 12:15:00  
12:15:00
>time
 12:15:02
>
>save
EEPROM saved successfully.
>
```

### NOTE

Only approximately 1 % accuracy is obtained with the software clock.
Networking Operation

When several transmitters are connected to the same RS485 bus it is recommended to use separate power supplies for each transmitter. Make sure that the devices are grounded to the same potential. Otherwise harmful ground currents may be generated or RS-485 common-mode limits may be exceeded.

For long RS485 bus lengths a proper termination should be provided.

Setting the Transmitter Address

ADDR aa <cr>

SAVE <cr>

aa=address (0...99)

Example (changing address from 0 to 1):

>addr
ADDR : 0 ? 1
>
>save
EEPROM saved successfully.
>
Open and Close

OPEN nn <cr>

nn=address of the transmitter (0...99)

The OPEN command sets the bus temporarily in STOP mode so that the SMODE command can be entered.

CLOSE <cr>

In STOP mode: Command OPEN has no effect, CLOSE sets the transmitter temporarily in POLL mode.

In POLL mode: Command OPEN sets the transmitter temporarily in STOP mode.
Example:

>close
line closed
GMP343: 1 line opened for operator commands
>send
351.1 ppm
>smode stop
SMODE : STOP
>

Setting Echoing Mode

ECHO x <cr>
SAVE <cr>

x=ON/OFF (default ON)

In RS232 mode the device echoes everything back to the user. In RS485 mode echoing is automatically disabled.

Preparation for Network Operation

Before GMP343 is connected to the network it must be configured. Normal procedure is shown below:

First connect the device to PC by using RS-232 and when communication is currently open, key in the following commands:

RSMODE 485
ADDR addr
(where addr is 1...99)
SMODE POLL
SAVE

Next turn the power off. Then you can connect the device to RS-485 network.
Commands during Network Operation

When GMP343 is connected to the network, the following commands can be entered:

**SEND addr**  Return latest CO\textsubscript{2} value

**XP addr pressure**  Set pressure for compensation

**XO addr oxygen**  Set oxygen for compensation

**XRH addr humidity**  Set humidity for compensation

**OPEN addr**  Open device for normal communication (i.e. to STOP-mode)

**CLOSE**  Switch the device from STOP-mode to POLL-mode.

Compensation values that are entered with compensation commands (XP, XO, XRH) are used for compensation but they are not stored permanently. Note that compensation commands do not give any reply. If value in command is not acceptable, the command is rejected.

Measurement Range, Data Filtering and Linearization

Setting the Measurement Range

The measurement range of the GMP343 has been set at factory according to the order form. However, you can change the measurement range to optimize measurement performance for a certain concentration level.

To achieve the most accurate 'ppm CO\textsubscript{2}' measurement, the measurement should be compensated for T, P, %RH, and O\textsubscript{2} concentration in the environment. The compensation settings are specific to the selected measurement range, so selecting a suitable measurement range optimizes the compensation performance. Each range also has its own linearization function; see section Linearization on page 46.
There are 6 measurement ranges available. The range always begins with zero and only upper end value is changed.

**RANGE** x

**SAVE**

x = 1..6

**Example:**

```
>range 4
1. SPAN (ppm) : 1000.00
2. SPAN (ppm) : 2000.00
3. SPAN (ppm) : 3000.00
4. SPAN (ppm) : 4000.00
5. SPAN (ppm) : 5000.00
6. SPAN (ppm) : 20000.00
```

RANGE : 4

```
>save
EEPROM saved successfully.
```

**NOTE**

**RANGE**-command only optimizes measurement. The scaling of the analog output is an independent issue. Normally it is necessary to change also ALOW and AHIGH values. For more information, see section, Setting and Testing the Analog Outputs, on page 52.

**Measurement Data Filtering**

The raw measurement values (measurement interval = 2 seconds) are an input to a chain of three filters: a median, an averaging, and a smoothing filter. The filters can be individually enabled or disabled by setting the filter coefficient to 0 (zero) or by choosing CO2RAW instead of CO2 for the measurement output quantity (see **FORM** command).

![Diagram of measurement data filtering]

**Figure 8**  Entering Measurement Values
Median Filter

Median filter is the first section in the filter chain, removing random peak values caused by external interference. The output of the median filter is the moving median of the values over the set number of measurements. The median filter arranges the values in the order of magnitude and outputs the middle value (not the average) if the number of the measurements is odd. In case an even number is set, the output is the average of the two middlemost measurements.

The lowest reasonable set number of measurements is 3. Note that if the noise distribution is somewhat uniform the median filter does not give any additional value.

The number of the measurements is set by the MEDIAN command. Maximum number of measurements is 13. The default value is 0 (meaning that the median filter is disabled).

Averaging Filter

The averaging filter calculates a moving average over the user-set period of time. The longer the averaging time is the lower the noise at the measurement signal. For example, if the averaging is set to 30 seconds, the most recent average filter output is the average of the last 15 measurements (2 seconds measurement interval).

The averaging time is set by the AVERAGE command. The default value is 10 seconds, and the maximum filter length is 60 seconds. For longer averaging times, use the smoothing filter instead. Table 6 on page 43 presents the measurement noise as a function of averaging time at 370 ppm CO₂:

<table>
<thead>
<tr>
<th>Averaging Time</th>
<th>Noise</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 s</td>
<td>3 ppm</td>
</tr>
<tr>
<td>10 s</td>
<td>2 ppm</td>
</tr>
<tr>
<td>30 s</td>
<td>1 ppm</td>
</tr>
</tbody>
</table>
Smoothing Filter

The smoothing filter calculates the running average by weighting the most recent measurement by the user-set proportion of the preceding measurement.

By using the smoothing filter, averaging up to even 15 minute periods can be accomplished. The smoothing filter is feasible for the background measurement where fast changes in the CO₂ concentration are not common. See the next section to find the difference between smoothing and averaging in regard to response time.

The smoothing factor is set by the SMOOTH command, where the range of the factor is 0 .. 255. The relationship between averaging and smoothing from the noise reducing point of view is like follows:

\[(\text{SMOOTHING FACTOR} \times 4) = \text{approx. AVERAGING TIME (s)}\]

The default value is 0 (meaning that the smoothing filter is disabled).

How the Filtering Affects the Response Time

The following figure illustrates the difference of the two filters in regard to time response. The averaging time is set to 40 seconds while the smoothing factor is set to 10 to have about equal noise rejection properties. See also the response time tables presented in Specifications, Response time (90 %), on page 80.

Figure 9  The Difference of the Two Filters in Time Response
Setting the Median Filter

Use the median filter to remove random peak values caused by possible external interference.

MEDIAN x <cr>

SAVE <cr>

x=0...13 (default=0)

>median 3
MEDIAN : 3
>save
EEPROM saved successfully (829 ms).

Setting the Averaging Filter

Use the averaging filter to reduce the noise of the measurement. Notice the effect on the response time.

AVERAGE x <cr>

SAVE <cr>

x=0...60 seconds (default =10 s)

>average 20
AVERAGING (s) : 20
>save
EEPROM saved successfully (829 ms).

Setting the Smoothing Filter

Use the smoothing filter to reduce the noise of the measurement for long averaging periods. Notice the effect on the response time.

SMOOTH x <cr>

SAVE <cr>

x=0...255 (default =0)
>smooth 10
SMOOTH : 10
>save
EEPROM saved successfully (829 ms).
>

**Flushing the Filters (Resynchronization)**

With this command you can flush the filters to get rid of the effect of the past measurements. This feature is useful if long filtering lengths are used.

RESYNC <cr>

>resync
>

**Linearization**

Due to the principle of the CO₂ absorption, the sensor of GMP343 produces a signal which is not linear in relation to the CO₂ concentration. However, the output signal is linearized with the internal linearization function. The user can disable the internal linearization function to achieve a signal proportional to the absorption.

**Setting the Linearization ON/OFF**

LINEAR x <cr>

SAVE <cr>

x=ON or OFF (default=ON)

**Example:**

>linear
LINEAR : ON ?
>
>save
EEPROM saved successfully.
>

>
Temperature, Pressure, Relative Humidity, and Oxygen Compensations

The measurement result of an NDIR CO₂ sensor such as the GMP343 is proportional to the absolute number of CO₂ molecules in the active volume of the sensor. Hence, according to the ideal gas law, the 'ppm CO₂' output is pressure and temperature dependent. Additionally, background gases such as humidity and oxygen have an effect on the absorption strength of CO₂.

The factory calibration of GMP343 is carried out using dry N₂ and CO₂ mixtures. In other words, the relative humidity and the oxygen concentration of the calibration gases are 0 %.

To achieve the most accurate 'ppm CO₂' measurement, the measurement should be compensated for T, P, % RH, and O₂ concentration in the environment. In GMP343 these compensations are a built-in option. The compensated output corresponds to 'ppm CO₂' in the actual environment (T, P, RH, and O₂). The temperature, pressure, relative humidity, and oxygen compensations are enabled as a factory default (default environmental parameters: pressure 1013 hPa, relative humidity 50 % RH, oxygen 20.95 % O₂). The compensation settings are specific to the selected measurement range, so selecting a suitable measurement range also optimizes the compensation performance.

The compensation algorithm of GMP343 eliminates the dependences of the CO₂ measurement, whether they are related to the physics of the measurement or the instrument itself. The temperature compensation of GMP343 is based on built-in temperature sensor while the values of the other environmental parameters should be changed by the user, if they vary from the default.

Note, that from the measurement accuracy point of view, the effect of humidity and oxygen is less significant compared to the effect of temperature and pressure.

Without compensation, the effect of oxygen on the CO₂ reading is approximately - 0.09 % of reading / % O₂. In most circumstances, the oxygen concentration does not vary from the default, so normally there is no need to change the oxygen concentration settings.
Without compensation, the effect of humidity on the CO₂ reading is approximately 0.05 % of reading / g/m³ H₂O. Since relative humidity is strongly dependent on temperature, the humidity dependence is in terms of absolute humidity, g/m³ H₂O.

Compensation of each environmental parameter can be disabled/enabled individually by setting the corresponding software parameter 'OFF' or 'ON', or by choosing CO2RAWUC for the measurement quantity (see FORM command).

The internal compensation of GMP343 is the most accurate way to compensate for changing environmental parameters. However, if more information is needed on different compensations, please contact your Vaisala representative.

**Temperature Compensation ON/OFF**

The internal temperature sensor is located in the measurement chamber. Temperature compensation is done automatically unless for some reason you want to take the compensation feature off.

To enable or disable temperature compensation, use the commands:

```
TC x <cr>
SAVE <cr>
```

x=ON/OFF (default =ON)

```>tc on
TC : ON
>tc off
TC : OFF
>
>save
EEPROM saved successfully.
>```
Setting the Oxygen Concentration

To set the oxygen concentration value, use the commands:

\[ O \ x \ <cr> \]
\[ \text{SAVE} \ <cr> \]

\[ x=0...100 \% \ (\text{default }=20.95 \%) \]

\[ >o \ 21 \]
\[ \text{OXYGEN} \ (\%) : 21.00 \]
\[ >\text{save} \]
\[ \text{EEPROM saved successfully.} \]

Setting Oxygen When the Device Is in POLL-mode

To set oxygen value in POLL-mode, use the following addressable command:

\[ \text{XO addr} \ x \ <cr> \]

The device does not reply to the command. If given oxygen value is not within limits, the command is rejected. The given value is written to volatile memory, where it will be overwritten either by next XO-command or O-command. At start the first compensation value is a value given by O-command if it was saved by SAVE-command. Purpose of the XO-command is continuous update of compensation value sent by another measurement device.

Oxygen Compensation Mode

To enable or disable the oxygen compensation, use the commands:

\[ \text{OC} \ x \ <cr> \]
\[ \text{SAVE} \ <cr> \]

\[ x=\text{ON/OFF} \ (\text{default }=\text{ON}) \]
Setting the Ambient Pressure (hPa)

The pressure value is needed in pressure, humidity, and oxygen compensations. To set the ambient pressure value, use the commands:

\[ P \ x \ <cr> \]
\[ \text{SAVE} \ <cr> \]

\[ x=700...1300 \text{ hPa (default = } 1013 \text{ hPa)} \]

Sets ambient pressure (hPa) to be used in compensation calculations.

\[ >p \ 1100 \]
\[ \text{PRESSURE (hPa)): 1100.000} \]
\[ >p \]
\[ \text{PRESSURE (hPa): 1100.000 ?} \]
\[ > \]
\[ \text{SAVE} \]
\[ \text{EEPROM saved successfully.} \]

Setting Pressure When the Device Is in POLL-mode

To set pressure value in POLL-mode, use the following addressable command:

\[ \text{XP addr} \ x \ <cr> \]

The device does not reply to the command. If given pressure value is not within limits, the command is rejected. The given value is written to volatile memory, where it will be overwritten either by next \text{XP}\-command or \text{P}\-command. At start the first compensation value is a

NOTE

Check that the ambient pressure value is correct. The correct pressure value is needed for oxygen compensation even if the pressure compensation is disabled.
value given by \texttt{P}-command if it was saved by \texttt{SAVE}-command. Purpose of the \texttt{XP}-command is continuous update of compensation value sent by another measurement device.

**Pressure Compensation ON/OFF**

To enable or disable the pressure compensation, use the commands:

\begin{verbatim}
PC x <cr>
SAVE <cr>
x=ON/OFF (default =ON)
>pc off
PC: OFF
>pc on
PC : ON ?
>save
EEPROM saved successfully.
>
\end{verbatim}

**Setting Ambient Relative Humidity**

To set the ambient relative humidity value, use the commands:

\begin{verbatim}
RH x <cr>
SAVE <cr>
x=0 ... 100 % RH (default =50 %)
>rh
HUMIDITY (%RH): 0.00 ? 24
>save
EEPROM saved successfully.
>
\end{verbatim}

**Setting Humidity When the Device Is in POLL-mode**

To set relative humidity value in POLL-mode, use the following addressable command:

\begin{verbatim}
XRH addr x <cr>
\end{verbatim}
The device does not reply to the command. If given humidity value is not within limits, the command is rejected. The given value is written to volatile memory, where it will be overwritten either by next XRH-command or RH-command. At start the first compensation value is a value given by RH-command if it was saved by SAVE-command. Purpose of the XRH-command is continuous update of compensation value sent by another measurement device.

Relative Humidity Compensation ON/OFF

To enable or disable the humidity compensation, use the commands:

RHC x <cr>
SAVE <cr>

x=ON/OFF (default =ON)

NOTE
Check that the ambient pressure value is correct. The correct pressure value is needed for RH compensation even if the pressure compensation is disabled.

>rhc on
RHC : ON
>rhc off
RHC : OFF
>
save
EEPROM saved successfully.
>

Setting and Testing the Analog Outputs

GMP343 has one analog output channel. The channel outputs either current or voltage signal according to the order configuration. The analog output always gives the filtered CO₂ results regardless of the quantity set with FORM command.
Analog Output Hardware

AMODE <cr>
SAVE <cr>

Analog output hardware can be chosen between current or voltage output. Command parameters are correspondingly I (for current) and U (for voltage).

>amode
AMODE : I ? U
>
>save
EEPROM saved successfully.
>
You can scale the chosen analog output signal as follows:

- When you have current output, you can set any value between 0 ... 4 mA for the current signal low level. The default value is 4 mA (command ILOW). The high value is always 20 mA.
- When you have voltage output, you can set any value between 0 ... 5 for the voltage signal high level (command UHIGH). The low value is always 0 V.

Remember to set the analog output error value within the range of current/voltage output. See the command AERR.

The concentration range of the analog output, corresponding to the signal range set above, can be chosen by determining the low and high values for the measurement range (AHIGH, ALOW).

Setting the Limit of the Current Output Range

You can expand the current output range for example 4...20 mA to 0...20 mA. The range available is 0...4 mA.

ILOW <cr>
SAVE <cr>
Key in the low current value (mA) and press ENTER.

>ilow
ILOW (mA) : 4.000 ? 0
>save
EEPROM saved successfully.
>

### Setting the High Limit of the Voltage Output Range

You can set the hight voltage value: 0...5 V.

UHIGH <cr>
SAVE <cr>

Key in the high voltage value (V) and press ENTER.

>uhigh
UHIGH (V) : 5.000 ? 1
>
>save
EEPROM saved successfully.
>

### Setting the High Limit of the Concentration Range

Sets the high CO₂ concentration value, which corresponds to the analog output high value.

AHIGH <cr>
SAVE <cr>

Key in the highest concentration value (ppm) and press ENTER.

>ahigh
AHIGH (ppm) : 1000.0 ? 1200
>
>save
EEPROM saved successfully.
>
Setting the Low Limit of the Concentration Range

Sets the low CO\textsubscript{2} concentration value, which corresponds to the analog output low value.

**ALOW <cr>**

**SAVE <cr>**

Key in the lowest concentration value (ppm) and press ENTER.

```
> alow
ALOW (ppm) : 0.0  ? 20
>
> save
EEPROM saved successfully.
>
```

Setting the Analog Output Overrange Clip

This command clips the analog output signal at the high value when the signal goes over range. In case of the current output the current will not go higher than 20 mA or below the low value current (set with **ILOW**). The voltage output will not go higher than the voltage set with **UHIGH**.

**ACUT x <cr>**

**SAVE <cr>**

x=ON/OFF

```
> acut
ACUT : OFF ? ON
>
> acut
ACUT : ON ? OFF
>
> save
EEPROM saved successfully.
>
```
Testing the Analog Output

When you want to test the operation of the analog output use this command to force the output to the set value. The value in the analog output can then be measured with a current/voltage meter. The set value remains valid until you give the ATEST command without a value or RESET the transmitter.

**ATEST <cr>**

x=the given test value (mA or V)

>atest 1
Test voltage set at 1 V. Use command without any parameters to stop test mode.
>atest
Voltage test mode stopped.

Setting the Analog Output Error Level

Factory default states for analog outputs during error condition are the maximum values of the measuring range=2.5 V / 5 V / 20 mA.

**AERR x <cr>**

SAVE <cr>

x=error value (mA) or (V)

Acceptable ranges: 0...20 mA, 0...6 V

**Example:**

>err
AERR (V) : 5.000 ? 0
>
>save
EEPROM saved successfully.
>
---

**NOTE**

The error output value must be within a valid range for current (0...20 mA) or voltage output (0...6 V) regardless of the UHIGH setting.
Device Information and Other General Commands

Device Information List

This command outputs the information about the device.

? <cr>

This command outputs the information about the device even in POLL-mode.

Memory Handling

Reverting the Factory Parameters

Use this command to revert the original factory settings.

>factory
Parameters loaded from Flash.
>

Remember to check the settings after using this command.

Saving the Setting

SAVE <cr>

Saves the parameters and settings to EEPROM memory.
Setting the Optics Heating ON/OFF

Enables or disables optics heating.

HEAT <cr>

x=ON or OFF (default =ON)

Example:

>heat
HEAT : ON ? off
>

Resetting the Transmitter

RESET <cr>

This command resets the device. If the device is in RUN mode, outputting the results starts immediately after resetting.
CHAPTER 5
CALIBRATION AND ADJUSTMENT

This chapter contains information for performing the calibration and adjustment of the GMP343.

In this user's guide the term calibration means comparing the transmitter's reading to a reference concentration. Adjustment, which is usually done after calibration, the reading of the transmitter is changed to correspond to the reference concentration. After adjustment, the original calibration certificate shipped with the product is not valid anymore.

The GMP343 can be sent to Vaisala for calibration, or be calibrated by the user.

Calibration Interval

GMP343 is calibrated as shipped from the factory. The recommended calibration interval is one year. The operating conditions affect the long-term stability. For more information, see Specifications, Operating Conditions, on page 81 and, Performance, on page 77 (long-term stability). In a harsh operating environment it is recommended to check readings more often than in an easy environment.
Factory Calibration and Adjustment

You can send the device to Vaisala Service Center for calibration and adjustment, for more information, see, Vaisala Service Centers, on page 76.

Calibration and Adjustment by the User

Calibration and adjustment are carried out by using the serial communications and the calibration gas(es).

Additional equipment needed:
- power supply 11...36 VDC
- PC and PC connection cable (Vaisala order code 213379) with optional USB adapter (Vaisala order code 219686)
- calibration gases and tubing
- calibration adapter is required for calibrating the diffusion model (Vaisala order code GMP343ADAPTER)
- pressure regulator and flow meter
- barometer (for measuring ambient pressure)

Calibration (Checking)

The gas concentration of the reference gases must cover the measurement range of the device.

Checking the Compensations

1. Connect GMP343 to a PC and open the terminal program. For more information, see section Connecting GMP343 to PC on page 29.
2. Connect the 24 VDC supply power to GMP343.
3. Compensations must always be enabled during the calibration procedure. Use the ? command to verify the status of the compensations for ambient pressure, temperature, relative humidity, and oxygen concentration:
   ?<cr>
4. If all compensations are not enabled, make note of the current settings so that you can restore them after the calibration if desired. Then issue the following commands to enable the compensations:

- **PC ON**
- **TC ON**
- **RHC ON**
- **OC ON**

5. You must also set the ambient pressure, relative humidity, and oxygen concentration values of the calibration gas correctly. Typically the relative humidity of the calibration gases is 0% RH. Oxygen concentration of nitrogen mixture gases is usually 0%. If necessary, adjust the values. For example:

- **P 1000.3**
- **RH 0**
- **O 0**

For more information on compensations, see section Temperature, Pressure, Relative Humidity, and Oxygen Compensations on page 47.

**Measurements in Reference Gases**

1. If your GMP343 is the diffusion model, remove the filter cover and place the calibration adapter onto the probe.

2. Let the device warm up for 30 minutes to achieve full calibration accuracy.

3. Turn on the calibration mode by giving the command **CALIB ON**. This changes some of the transmitter parameters for the duration of the calibration.

- **CALIB ON**

4. Connect the reference gas to the inlet of GMP343 transmitter and let the gas flow for 5 minutes (about 0.5 l / min).

5. To output the measurement result, key in the command **R**. Check that the reading is stabilized and write down the CO₂ reading (ppm). Enter command **S** to stop outputting. For the best calibration result, it is recommended to calculate an average of 20 measurements instead of a single reading.
6. Shut off the reference gas flow and remove the tubings from the gas bottle. When calibrating at several points, connect the other gases to GMP343 similar to the first gas and carry out the measurements as instructed above (steps 6 and 7).

7. After measurements turn off the calibration mode by giving the command **CALIB OFF** (this reverts to the original transmitter settings).

```
CALIB OFF <cr>
```

## Adjustment in 1...2 Points

First carry out checking the compensations and perform the reference gas measurements as instructed in the previous section, *Calibration and Adjustment by the User on page 64*. Then continue as follows:

1. Key in the command

   `LCI <cr>`

2. Key in the **reading** at the reference gas (ppm) and press ENTER (1.Reading?).

3. Key in the **reference** gas concentration (ppm) and press ENTER (Reference?).

4. When making a one-point calibration press ENTER again and go to step 6 in this list. When making a two-point calibration, key in the reading at the **second reference** gas and press ENTER (2.Reading?).

5. Key in the **reference** gas 2 concentration (ppm) and press ENTER (Reference?).

6. Now the correction values are calculated, but the adjustment is not valid until the correction is confirmed.

7. Confirm the new correction values with the command

   `LC ON <cr>`

8. Use the command **R** to check with both reference gases that the correction has taken place and the readings are ok.

9. Save the settings:

   `SAVE <cr>`

10. Saves parameters and settings to EEPROM memory.
Adjustment in 3...8 Points

First carry out checking the compensations and perform the reference gas measurements as instructed in the previous section, Calibration and Adjustment by the User on page 64. Then continue as follows:

1. Feed the readings (Reading?) and the corresponding concentrations (Reference?) with the command
   
   MPCI <cr>

2. Confirm the adjustment and the new correction values with the command
   
   MPC ON <cr>

3. Save the settings with the command
   
   SAVE <cr>

4. Saves parameters and settings to EEPROM-memory.

Example of the 2-Point Adjustment Procedure

The following section presents an example of the 2-point adjustment procedure with reference gas concentrations of 0 ppm and 1007 ppm.

<table>
<thead>
<tr>
<th>NOTE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use the actual concentrations given usually in the side of the gas bottle. For example, a gas with a nominal 1000 ppm CO₂ concentration might actually contain 1007 ppm CO₂.</td>
</tr>
</tbody>
</table>

1. First turn on the calibration mode for measuring reference gases.

   >
   >calib on
   Calibration mode started.
   Use CALIB OFF to stop the mode.

2. The GMP is now measuring the first reference gas (0 ppm). Use command R and let the reading stabilize for several minutes. Calculate the average reading (reading 1).

   >r
   ...28.2
   28.2
   28.1
   28.1
   28.2
3. The GMP343 is now measuring the second reference gas (1007 ppm). Use command R and let the reading stabilize for several minutes. Calculate the average reading (reading 2).

```
> r
1067.1
1066.8
1067.2
1066.7
1066.6
```

4. Turn off the calibration mode with command CALIB OFF.

```
> calib off
Calibration mode stopped.
```

5. Next feed the readings: use command LCI to feed the first and second reference gas readings (28 ppm and 1066 ppm), and the corrected values (= the concentrations of the reference gases, 0 ppm and 1007 ppm).

```
> lci
Reading Reference
 0.00  0.000
1000.00 1000.000

NOTE: Entering new correction values all previous correction points!
Abort without losing correction points by using ESC.

1. Reading ? 28
   Reference ? 0
2. Reading? 1066
   Reference? 1007
```

6. Confirm the adjustment with command LC ON.

```
> lc
LC : OFF ? on
```

7. Check the reading with the second reference gas, 1007 ppm.

```
> r
1005.4
1006.2
1007.1
1007.1
```
8. Check the reading with the first reference gas, 0 ppm.

   > r
   0.2
   0.1
   -0.1
   -0.1
   -0.0
   -0.2

9. Save the settings.

   save>
   EEPROM saved successfully.
   >

**NOTE**  The factory settings can be reverted with the command FACTORY.
CHAPTER 6
MAINTENANCE

This chapter instructs in the basic maintenance of the GMP343.

Cleaning the Optics (Diffusion Model Only)

Figure 10 Optics

The following numbers refer to Figure 10 on page 71:

1 = Mirror

2 = Window
1. Rotate and remove the filter cover.

2. Take a firm hold on the frame of the diffusion filter, and pull it out. Note that the threads for the filter cover are sharp.

3. Blow on the mirror and window area with instrument air to remove any loose particles. In case there is still some dirt on the surfaces, proceed to step 3.

4. Pour some distilled water on the optical surfaces so that they are covered with water. Pour out the excess water.

5. Take a piece of soft, clean paper tissue (optical or clean room grade tissue) and gently dry the surface with rotating movements.

6. If the mirror and/or window surface still seems dirty after water cleaning, clean the dirty surface with pure ethanol or isopropyl alcohol. Pour out the excess liquid carefully.
   After cleaning the surfaces should appear clear, without any oily stains, spots, or dust.

7. After cleaning, replace the diffusion filter. Push the end of the filter gently to snap it into place.

8. Replace the filter cover.

**NOTE**
Handle the diffusion filter carefully to prevent contaminants or mechanical stress from damaging the filtering surface.
Changing the Filter (Diffusion Model Only)

The diffusion filter should be changed when it looks dirty. A new standard diffusion filter and filter cover can be ordered from Vaisala with the order code GMP343FILTER.

**NOTE**
Handle the diffusion filter carefully to prevent contaminants or mechanical stress from damaging the filtering surface.

1. Rotate and remove the filter cover.
2. Take a firm hold on the frame of the diffusion filter, and pull it out. Note that the threads for the filter cover are sharp.
3. Insert a new diffusion filter. Push the end of the diffusion filter gently to snap it into place.
4. Replace the filter cover.
Error States

In case of an error function the outputs are as follows:

- Serial line: In STOP mode the error code and description (see the Table 6 below) is shown when keying in the command: **ERRS**. In POLL or RUN mode the error flag is set to 1 (if the error flag is included in the message format, see **FORM**-command). Reset the error state with a command **ERRS R**.

- Analog output shows the error level (can be set by using the **AERR**-command. Factory setting: 5 V or 20 mA).

</tbody>
</table>
In all error cases first check that the probe is connected properly, then reset the transmitter by disconnecting it. In case of constant error, please contact a Vaisala Service Center. See section Vaisala Service Centers on page 76.

### CAUTION

Please note that there are no user-serviceable parts inside the GMP343 transmitter body. The back flange shall not be opened except by authorized Vaisala service personnel.

### Technical Support

For technical questions, contact the Vaisala technical support:

- E-mail: helpdesk@vaisala.com
- Fax: +358 9 8949 2790

### Return Instructions

If the product needs repair, please follow the instructions below to speed up the process and to avoid extra costs to you.

1. Read the section Warranty on page 11.
2. Contact a Vaisala Service Center or a local Vaisala representative. The latest contact information and instructions are available from [www.vaisala.com/returns](http://www.vaisala.com/returns). Addresses of the Service Centers are provided in section Vaisala Service Centers on page 76.

Please have the following information on hand:

- serial number of the unit
- date and place of purchase or last calibration
- description of the fault
- circumstances in which the fault occurs/occurred
- name and contact information of a technically competent person who can provide further information on the problem

3. Pack the faulty product in a strong box of adequate size, with proper cushioning material to avoid damage.
4. Include the information specified in step 2 in the box with the faulty product. Also include a detailed return address.
5. Ship the box to the address specified by your Vaisala contact.
Vaisala Service Centers

The GMP343 has been calibrated by Vaisala prior to shipping. The recommended calibration interval is one year. Vaisala Service Centers perform calibrations and adjustments as well as repair and spare part services. See contact information below.

Vaisala Service Centers also offer accredited calibrations, maintenance contracts, and a calibration reminder program. Do not hesitate to contact them to get further information.

CHAPTER 7
TECHNICAL DATA

This chapter provides the technical data of the GMP343.

Performance

Sensor
Vaisala CARBOCAP®

Measuring principle
Single-Beam Dual-Wavelength NDIR

Measurement range options
0 ... 1000 ppm
0 ... 2000 ppm
0 ... 3000 ppm
0 ... 4000 ppm
0 ... 5000 ppm
0 ... 2 %

Accuracy (excluding noise) at 25 °C and 1013 hPa after factory calibration with 0.5 % accurate gases with different range options

0 ... 1000 ppm
± (3 ppm CO₂ + 1 % of reading)

0 ... 2000 ppm - 0 ... 2 %*
± (5 ppm CO₂ + 2 % of reading)

* Accuracy below 200 ppm CO₂ not specified for the 2 % range option
Effects of Temperature, Pressure, Relative Humidity, and Oxygen

The temperature compensation of GMP343 is based on the built-in Pt1000 temperature sensor. The values of pressure, relative humidity, and oxygen must be input by the user, if they vary from the default.

Temperature

The specifications in the table above are valid when temperature change is < 1 °C / min. If optics heating is in use, the > 500 ppm accuracy values should be multiplied by a factor of 2.

For readings below 200 ppm CO₂: ± 5 ppm CO₂

Effect on accuracy without compensation (typ.):
- 0.35 % of reading / °C
Pressure

Table 9  Effect of Pressure on Accuracy with Pressure Compensation

<table>
<thead>
<tr>
<th>CO₂ range option</th>
<th>0 ... 1000 ppm</th>
<th>0 ... 2000 ppm - 2 %</th>
</tr>
</thead>
<tbody>
<tr>

<td>± 0.5</td>
<td>± 1</td>
</tr>
<tr>
<td>700 ... 1300</td>
<td>± 1</td>
<td>± 2</td>
</tr>
</tbody>
</table>

Effect on accuracy without compensation (typ.): + 0.15 % of reading /hPa

Humidity

Effect on accuracy with humidity compensation:

\[ \pm 0.006 \text{ % of reading} / g/m^3 H₂O \text{ below 1000 ppm CO}_₂ \]

\[ \pm 0.02 \text{ % of reading} / g/m^3 H₂O \text{ above 1000 ppm CO}_₂ \]

The values above only apply in normal ambient pressure. Effect on accuracy without humidity compensation (typ.):

\[ + 0.05 \text{ % of reading} / g/m^3 H₂O \]

For more information on operating humidity range, see the graph in section, Operating Conditions, on page 81.

Oxygen

Effect on accuracy with oxygen compensation at 20.9 %O₂:

\[ \pm 0.2 \text{ % of reading} \]

Effect on accuracy without oxygen compensation (typ.):

\[ - 0.09 \text{ % of reading} / %O₂ \]
Response time (90 %)

APPENDIX B

LIST OF COMMANDS

This appendix lists the serial commands of the GMP343.

Measurement Commands

The bold text in the brackets is a default setting. Key in the commands with the keyboard of your computer and press enter. In this guide, <cr> stands for pressing ENTER.

R  Start the continuous output
S  Stop the continuous output
ECHO  Turn the serial interface echo ON/OFF
INTV  Set the continuous output interval
SEND  Output the reading once
SMODE  Set the serial interface
SERI  Serial line settings (default 19200 8 NONE) baud: 300 ... 115200
ADDR  Set the device address
CLOSE  Close the line to POLL mode
OPEN  Open temporarily connection to the POLL-mode device
FORM  Set the output format of SEND and R commands
RSMODE  Set the output hardware to use either RS-232 or RS-485
Filtering Commands

AVERAGE
Set the averaging filter

SMOOTH
Set the smoothing filter

MEDIAN
Set the median filter

RESYNC
Flush (clear) all the filters

P, T and RH Compensation Commands

P
Set local pressure (hPa) for compensation

PC
Pressure compensation mode

RH
Set local humidity (% RH) for compensation

RHC
Humidity compensation mode

TC
Temperature compensation mode

O
Set the oxygen for compensation

OC
Oxygen compensation mode

XP
Set local pressure (hPa) for compensation (POLL-mode)

XO
Set oxygen for compensation (POLL-mode)

XRH
Set local humidity (% RH) for compensation (POLL-mode)

Device Handling Commands

RESET
Reset device

FACTORY
Revert the factory parameters

SAVE
Save parameters to EEPROM

Device Information Display Commands

?
Output the information about the device

??
Output the information about the device in POLL-state

CALCS
Display measured parameters

CORR
Display linear and multipoint corrections

ERRS
List the error messages
### List of commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HELP</td>
<td>List the commands on the current level</td>
</tr>
<tr>
<td>PARAM</td>
<td>Display parameters</td>
</tr>
<tr>
<td>TIME</td>
<td>Display or set time since reboot</td>
</tr>
<tr>
<td>VERS</td>
<td>Display the SW version information</td>
</tr>
</tbody>
</table>

### Calibration Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALIB ON</td>
<td>Turn on the calibration mode</td>
</tr>
<tr>
<td>CALIB OFF</td>
<td>Turn off the calibration mode</td>
</tr>
<tr>
<td>LC</td>
<td>Linear correction mode</td>
</tr>
<tr>
<td>LCI</td>
<td>Enter linear correction</td>
</tr>
<tr>
<td>MPC</td>
<td>Multipoint correction mode</td>
</tr>
<tr>
<td>MPCI</td>
<td>Enter multipoint correction</td>
</tr>
</tbody>
</table>

### Setting and Testing the Analog Outputs

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMODE</td>
<td>Set analog output HW (current or voltage mode)</td>
</tr>
<tr>
<td>AHIGH</td>
<td>Analog output high concentration value</td>
</tr>
<tr>
<td>ALOW</td>
<td>Analog output low concentration value</td>
</tr>
<tr>
<td>ACUT</td>
<td>Analog output over range cut</td>
</tr>
<tr>
<td>ILOW</td>
<td>Analog output low current value</td>
</tr>
<tr>
<td>UHIGH</td>
<td>Analog output high voltage value</td>
</tr>
<tr>
<td>AERR</td>
<td>Change the analog error output value</td>
</tr>
<tr>
<td>ATEST</td>
<td>Test the analog outputs</td>
</tr>
</tbody>
</table>

### Advanced Measurement Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LINEAR</td>
<td>Set linearization ON/OFF</td>
</tr>
<tr>
<td>HEAT</td>
<td>Set optics heating ON/OFF</td>
</tr>
<tr>
<td>RANGE</td>
<td>Set measurement range to optimize performance</td>
</tr>
</tbody>
</table>
